Scheme is a programming language, much like Python. In fact, many of Python’s design features were inspired by Scheme. The point of learning this language is twofold: one, we’re looking into what parts of Python generalize to other languages. Two, we want to start thinking about how to design and build (an interpreter for) a programming language, and it turns out Scheme is a nice one to build. In fact, we’ll show you enough of the language in this hour to write recursive procedures. This section covers the basics. You’ll learn the rest in lab and discussion. It’s pretty awesome that we’ll be picking up a whole new programming language within an hour.

Visit scheme.cs61a.org to try the online interpreter. Type (demo 'autopair) and the interpreter will automatically draw box-and-pointer diagrams whenever an expression evaluates to a Scheme pair.
1. What will Scheme output? Draw box-and-pointer diagrams to help determine this.

```
scm> 3.14

Solution: 3.14
```

```
scm> pi

Solution: Error
```

```
scm> (define pi 3.14)

Solution: pi
```

```
scm> pi

Solution: 3.14
```

```
scm> 'pi

Solution: pi
```

```
scm> (if 2 3 4)

Solution: 3
```

```
scm> (if 0 3 4)

Solution: 3
```

```
scm> (if #f 3 4)

Solution: 4
```

```
scm> (if nil 3 4)

Solution: 3
```

```
scm> (if (= 1 1) 'hello 'goodbye)

Solution: hello
```
scm> (define (factorial n)
   (if (= n 0)
       1
       (* n (factorial (- n 1)) )))

**Solution:** factorial

scm> (factorial 5)

**Solution:** 120

scm> (= 2 3)

**Solution:** #f

scm> (= '() '())

**Solution:** Error

scm> (eq? '() '())

**Solution:** #t

scm> (eq? nil nil)

**Solution:** #t

scm> (eq? '() nil)

**Solution:** #t

scm> (pair? (cons 1 2))

**Solution:** #t

scm> (list? (cons 1 2))

**Solution:** #f
2. Hailstone yet again Define a program called hailstone, which takes in two numbers seed and n, and returns the nth hailstone number in the sequence starting at seed. Assume the hailstone sequence starting at seed is longer or equal to n. As a reminder, to get the next number in the sequence, if the number is even, divide by two. Else, multiply by 3 and add 1.

Useful procedures

- quotient: floor divides, much like // in python
  
  (quotient 103 10) outputs 10

- remainder: takes two numbers and computes the remainder of dividing the first number by the second
  
  (remainder 103 10) outputs 3

Solution:

(define (hailstone seed n)
  (if (= n 0)
      seed
      (if (= 0 (remainder seed 2))
          (hailstone
             (quotient seed 2)
             (- n 1))
         (hailstone
             (+ 1 (* seed 3))
             (- n 1))))
)

3. Scheme Lists

scm> (cons 1 2)

Computer Science Mentors CS61A Fall 2017: Paul Bitutsky and Jason Goodman, with Colin Schoen, Kevin Lin, Thomas Zhang, Danelle Nachum, Jennie Chen, Nipun Ramakrishnan, Christopher Allsman, Nikunj Jain, Shreya Sahoo, Joshua Zeitsoff
Solution: \((1 \ . \ 2)\)

\[
\begin{array}{c}
1 \\
2
\end{array}
\]

\[
1 \rightarrow 2
\]

\[
\text{scm> (cons 1 (cons 2 nil))}
\]

Solution: \((1 \ 2)\)

\[
\begin{array}{c}
1 \\
2
\end{array}
\]

\[
1 \rightarrow 2
\]

\[
\text{scm> (cons 1 '(2 3 4 5))}
\]

Solution: \((1 \ 2 \ 3 \ 4 \ 5)\)

\[
\begin{array}{c}
1 \\
2 \\
3 \\
4 \\
5
\end{array}
\]

\[
1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 5
\]

\[
\text{scm> (cons 1 '(2 (cons 3))})
\]

Solution: \((1 \ 2 \ (\text{cons} \ 3))\)

\[
\begin{array}{c}
1 \\
2
\end{array}
\]

\[
1 \rightarrow 2
\]

\[
\text{cons} \rightarrow 3 \rightarrow 4
\]

\[
\text{scm> (cons 1 (2 (cons 3)))}
\]

Solution: 

\textbf{eval}: \text{bad function in : (2 (cons 3))}

\[
\text{scm> (define a '(1 2 . 3))}
\]
Solution:

```
(a)
```

```
scm> a
```

Solution:

```
(1 2 . 3)
```

```
scm> (car a)
```

Solution:

```
1
```

```
scm> (cdr a)
```

Solution:

```
(2 . 3)
```

```
scm> (cadr a)
```

Solution:

```
2
```

How can we get the 3 out of a?

Solution:

```
(cddr a)
```
3. Define well-formed, which determines whether lst is a well-formed list or not. Assume that lst only contains numbers.

; Doctests
> (well-formed '())
true
> (well-formed '(1 2 3))
true
; List doesn't end in nil
> (well-formed (cons 1 2))
false
; You do NOT need to check nested lists
> (well-formed (cons (cons 1 2) nil))
true

Solution:
; well-formed with nested if statements
(define (well-formed lst)
  (if (null? lst)
      #t
      (if (number? lst)
          #f
          (well-formed (cdr lst)))))

; well-formed with a cond statement
(define (well-formed lst)
  (cond ((null? lst) #t)
        ((number? lst) #f)
        (else (well-formed (cdr lst)))))

More Code Writing in Scheme
4. Define \texttt{is-prefix}, which takes in a list \texttt{p} and a list \texttt{lst} and determines if \texttt{p} is a prefix of \texttt{lst}.

; Doctests:
> (is-prefix '() '())
true
> (is-prefix '() '(1 2))
true
> (is-prefix '(1) '(1 2))
true
> (is-prefix '(2) '(1 2))
false
; Note here \texttt{p} is longer than \texttt{lst}
> (is-prefix '(1 2) '(1))
false

\textbf{Solution:}

; \texttt{is-prefix} with nested \texttt{if} statements
(define (is-prefix p lst)
  (if (null? p)
      #t
      (if (null? lst)
          #f
          (and
           (= (car p) (car lst))
           (is-prefix (cdr p) (cdr lst))))))

; \texttt{is-prefix} with a \texttt{cond} statement
(define (is-prefix p lst)
  (cond ((null? p) #t)
        ((null? lst) #f)
        (else (and (= (car p) (car lst))
                   (is-prefix (cdr p) (cdr lst))))))
