## Lists

### Lists in Environment Diagrams

Assume that before each example below we execute:  
`s = [2, 3]`  
`t = [5, 6]`

Operation	Example	Result
append adds one element to a list	<code>s.append(t)</code> <code>t = 0</code>	<code>s = [2, 3, [5, 6]]</code> <code>t = 0</code>
extend adds all elements in one list to another list	<code>s.extend(t)</code> <code>t[1] = 0</code>	<code>s = [2, 3, 5, 6]</code> <code>t = [5, 0]</code>
addition & slicing create new lists containing existing elements	<code>a = s + [t]</code> <code>b = a[1:]</code> <code>a[1] = 9</code> <code>b[1][1] = 0</code>	<code>s = [2, 3]</code> <code>t = [5, 0]</code> <code>a = [2, 9, [5, 0]]</code> <code>b = [3, [5, 0]]</code>
The <code>list</code> function also creates a new list containing existing elements	<code>t = list(s)</code> <code>s[1] = 0</code>	<code>s = [2, 0]</code> <code>t = [2, 3]</code>
slice assignment replaces a slice with new values	<code>s[0:2] = t</code> <code>s[3:] = t</code> <code>t[1] = 0</code>	<code>s = [5, 6, 2, 5, 6]</code> <code>t = [5, 0]</code>

### Lists in Lists in Lists in Environment Diagrams

```
t = [1, 2, 3]
t[1:3] = [t]
t.extend(t)
```

```
t = [[1, 2], [3, 4]]
t[0].append(t[1:2])
```

## Objects

### Land Owners

Instance attributes are found before class attributes; class attributes are inherited

```
class Worker:
    greeting = 'Sir'
    def __init__(self):
        self.elf = Worker
    def work(self):
        return self.greeting + ', I work'
    def __repr__(self):
        return Bourgeoisie.greeting

class Bourgeoisie(Worker):
    greeting = 'Peon'
    def work(self):
        print(Worker.work(self))
        return 'I gather wealth'

jack = Worker()
john = Bourgeoisie()
jack.greeting = 'Maam'
```

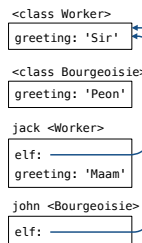

```
>>> Worker().work()
'Sir, I work'

>>> jack
Peon

>>> jack.work()
'Maam, I work'

>>> john.work()
Peon, I work
'I gather wealth'

>>> john.elf.work(john)
'Peon, I work'
```

## Linked Lists

## Recursive Lists Can Change

Attribute assignment statements can change first and rest attributes of a Link

The rest of a linked list can contain the linked list as a sub-list

```
>>> s = Link(1, Link(2, Link(3)))
>>> s.first = 5
>>> t = s.rest
>>> t.rest = s
>>> s.first
5
>>> s.rest.rest.rest.rest.rest.first
2
```

Trees

## Morse Code

Morse code is a signaling protocol that transmits messages by sequences of signals

Problem: Implement `morse` so that `decode` works correctly

```
abcde = {'a': '-.-', 'b': '-...', 'c': '-.-.', 'd': '-..', 'e': '...'}
```

```
def decode(signals, tree):
    """Decode signals into a letter.
    """
    def morse(code):
        ...
    >>> t = morse(abcde)
    >>> [decode(s, t) for s in ['-..', '-.-.', '-.-.', '-..', '.']]
    ['d', 'e', 'c', 'a', 'd', 'e']
    """
    for signal in signals:
        tree = [b for b in tree.branches if b.label == signal][0]
    leaves = [b for b in tree.branches if b.is_leaf()]
    assert len(leaves) == 1
    return leaves[0].label
```

(Demo)
