Aggregation
Aggregate Functions

So far, all SQL expressions have referred to the values in a single row at a time

```
[expression] as [name], [expression] as [name], ...
```

```
select [columns] from [table] where [expression] order by [expression];
```

An aggregate function in the [columns] clause computes a value from a group of rows

```
create table animals as
select "dog" as kind, 4 as legs, 20 as weight union
select "cat" , 4 , 10 union
select "ferret" , 4 , 10 union
select "parrot" , 2 , 6 union
select "penguin" , 2 , 10 union
select "t-rex" , 2 , 12000;
```

```
select max(legs) from animals;
```

```
animals:

<table>
<thead>
<tr>
<th>kind</th>
<th>legs</th>
<th>weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>dog</td>
<td>4</td>
<td>20</td>
</tr>
<tr>
<td>cat</td>
<td>4</td>
<td>10</td>
</tr>
<tr>
<td>ferret</td>
<td>4</td>
<td>10</td>
</tr>
<tr>
<td>parrot</td>
<td>2</td>
<td>6</td>
</tr>
<tr>
<td>penguin</td>
<td>2</td>
<td>10</td>
</tr>
<tr>
<td>t-rex</td>
<td>2</td>
<td>12000</td>
</tr>
</tbody>
</table>
```

```
<table>
<thead>
<tr>
<th>max(legs)</th>
<th>(Demo)</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td></td>
</tr>
</tbody>
</table>
```
Mixing Aggregate Functions and Single Values

An aggregate function also selects some row in the table to supply the values of columns that are not aggregated. In the case of max or min, this row is that of the max or min value. Otherwise, it is arbitrary.

```
select max(weight), kind from animals;
select min(kind), kind from animals;
select avg(weight), kind from animals;
```

(Demo)

```
create table animals as
select "dog" as kind, 4 as legs, 20 as weight union
select "cat"  , 4 , 10 union
select "ferret" , 4 , 10 union
select "parrot" , 2 , 6 union
select "penguin" , 2 , 10 union
select "t-rex"  , 2 , 12000;
```
Discussion Question

What are all the kinds of animals that have the maximal number of legs?
Groups
Grouping Rows

Rows in a table can be grouped, and aggregation is performed on each group

```
[expression] as [name], [expression] as [name], ...
```

```
select [columns] from [table] group by [expression] having [expression];
```

The number of groups is the number of unique values of an expression

```
select legs, max(weight) from animals group by legs;
```

<table>
<thead>
<tr>
<th>kind</th>
<th>legs</th>
<th>weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>dog</td>
<td>4</td>
<td>20</td>
</tr>
<tr>
<td>cat</td>
<td>4</td>
<td>10</td>
</tr>
<tr>
<td>ferret</td>
<td>4</td>
<td>10</td>
</tr>
<tr>
<td>parrot</td>
<td>2</td>
<td>6</td>
</tr>
<tr>
<td>penguin</td>
<td>2</td>
<td>10</td>
</tr>
<tr>
<td>t-rex</td>
<td>2</td>
<td>12000</td>
</tr>
</tbody>
</table>

(Demo)
Selecting Groups

Rows in a table can be grouped, and aggregation is performed on each group

```sql
select [columns] from [table] group by [expression] having [expression];
```

A `having` clause filters the set of groups that are aggregated

```sql
select weight/legs, count(*) from animals group by weight/legs having count(*)>1;
```

### animals:

<table>
<thead>
<tr>
<th>kind</th>
<th>legs</th>
<th>weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>dog</td>
<td>4</td>
<td>20</td>
</tr>
<tr>
<td>cat</td>
<td>4</td>
<td>10</td>
</tr>
<tr>
<td>ferret</td>
<td>4</td>
<td>10</td>
</tr>
<tr>
<td>parrot</td>
<td>2</td>
<td>6</td>
</tr>
<tr>
<td>penguin</td>
<td>2</td>
<td>10</td>
</tr>
<tr>
<td>t-rex</td>
<td>2</td>
<td>12000</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>weight/legs</th>
<th>count(*)</th>
</tr>
</thead>
<tbody>
<tr>
<td>weight/legs=5</td>
<td>2</td>
</tr>
<tr>
<td>weight/legs=2</td>
<td>2</td>
</tr>
<tr>
<td>weight/legs=2</td>
<td>2</td>
</tr>
<tr>
<td>weight/legs=3</td>
<td></td>
</tr>
<tr>
<td>weight/legs=5</td>
<td></td>
</tr>
<tr>
<td>weight/legs=6000</td>
<td></td>
</tr>
</tbody>
</table>
Discussion Question

What's the maximum difference between leg count for two animals with the same weight?
Example: Big Game

(Demo)
Create Table and Drop Table
Create Table

CREATE TABLE expression syntax:

Examples:

CREATE TABLE numbers (n, note);
CREATE TABLE numbers (n UNIQUE, note);
CREATE TABLE numbers (n, note DEFAULT "No comment");
Drop Table
Modifying Tables
For a table t with two columns...

To insert into one column:

```
INSERT INTO t(column) VALUES (value);
```

To insert into both columns:

```
INSERT INTO t VALUES (value0, value1);
```

(Demo)
Update sets all entries in certain columns to new values, just for some subset of rows.

(Demo)
Delete removes some or all rows from a table.

Python and SQL

(Demo)
SQL Injection Attack
A Program Vulnerable to a SQL Injection Attack

name = "Robert''); DROP TABLE Students; --"

```sql
INSERT INTO Students VALUES ('" NAME: ''');
```

```python
db.executescript(cmd)  
db.execute("INSERT INTO Students VALUES (?)", [name])
```

```
INSERT INTO Students VALUES ('Robert'); DROP TABLE Students; --');
