1 Nonlocal

Questions

1.1 Draw an environment diagram for the following code:

```python
spiderman = 'peter parker'
def spider(man):
    def myster(io):
        nonlocal man
        man = spiderman
        spider = lambda stark: stark(man) + ' ' + io
        return spider
    return myster

truth = spider('quentin is')('the greatest superhero')(lambda x: x)
```
1.2 Draw an environment diagram for the following code:

```python
fa = 0
def fi(fa):
    def world(cup):
        nonlocal fa
        fa = lambda fi: world or fa or fi
        world = 0
        if (not cup) or fa:
            fa(2022)
            fa, cup = world + 2, fa
            return cup(fa)
        return fa(cup)
    return world

won = lambda opponent, x: opponent(x)
us = won(fi(fa), 2019)
```
Write \texttt{make\_max\_finder}, which takes in no arguments but returns a function which takes in a list. The function it returns should return the maximum value it's been called on so far, including the current list and any previous list. You can assume that any list this function takes in will be nonempty and contain only non-negative values.

\begin{verbatim}
def make_max_finder():
    """
    >>> m = make_max_finder()
    >>> m([5, 6, 7])
    7
    >>> m([1, 2, 3])
    7
    >>> m([9])
    9
    >>> m2 = make_max_finder()
    >>> m2([1])
    1
    """

\end{verbatim}
1.4 Check your understanding:

```python
x = 5
def f(x):
    def g(s):
        def h(h):
            nonlocal x
            x = x + h
            return x
        nonlocal x
        x = x + x
        return h
    print(x)
    return g

t = f(7)(8)(9)
```

a. What is t after the code is executed?
b. In the h frame, which x is being referenced? Which frame?
c. In the g frame, is a new variable x being created?
2 Iterators and Generators

Questions

2.1 What is the definition of an iterable? What is the definition of an iterator? What is the definition of a generator? What built-in functions or keywords are associated with each. Give an example of each.

2.2 Evaluate if each line is valid? If not, state the error and how you would fix it.

```python
>>> new_list = [2, 3, 6, 8, 8, 3]
>>> next(new_list)

>>> iter(new_list)[1]

>>> [x for x in iter(new_list)]

>>> for i in range(len(iter(new_list))):
...     new_list.append(2)
```
2.3 What is the difference between these two statements?

a.  
```python
def infinity1(start):
    while True:
        start = start + 1
    return start
```

b.  
```python
def infinity2(start):
    while True:
        start = start + 1
        yield start
```

(a) is a function since it uses a `return` statement. Even tho `while True` is always true, it will stop after the first iteration when it returns `start`. On the other hand, (b) is a generator since it uses a `yield` statement. Since `while True` is always true, calling `next` will iterate once and `yield` `start`.

What would python display?

```plaintext
>>> infinity1
Function
>>> infinity2
Function
>>> infinity1(2)
3
>>> infinity2(2)
<Generator Instance>
>>> x = infinity1(2)
Nothing
>>> next(x)
Error, cant call next on integer
>>> y = infinity2(2)
Nothing
```
>>> next(y)
|\begin{solution}
3
\end{solution}|

>>> next(y)
|\begin{solution}
4
\end{solution}|

>>> next(infinity2(2))
|\begin{solution}
3
\end{solution}|
2.4 They can’t stop all of us!! Write a function `generate_constant` which, a generator function that repeatedly yields the same value forever.

```python
def generate_constant(x):
    """A generator function that repeats the same value x forever."
    >>> area = generate_constant(51)
    >>> next(area)
    51
    >>> next(area)
    51
    >>> sum([next(area) for _ in range(100)])
    5100
    """
```

2.5 4.2 Now implement `black_hole`, a generator that yields items in seq until one of them matches trap, in which case that value should be repeatedly yielded forever. You may assume that `generate_constant` works. You may not index into or slice `seq`.

```python
def black_hole(seq, trap):
    """A generator that yields items in SEQ until one of them matches TRAP, in which case that value should be repeatedly yielded forever."
    >>> trapped = black_hole([1, 2, 3], 2)
    >>> [next(trapped) for _ in range(6)]
    [1, 2, 2, 2, 2, 2]
    >>> list(black_hole(range(5), 7))
    [0, 1, 2, 3, 4]
    """
```
2.6 What Would Python Display?

```python
>>> def weird_gen(x):
... if x % 2 == 0:
...     yield x * 2
>>> wg = weird_gen(2)
>>> next(wg)
>>> next(weird_gen(2))
|\begin{solution}
4
4
\end{solution}|

```
Nonlocal, Iterators and Generators

>>> next(g)

Error, tuple is not iterator

An iterator ______________ a generator
A generator is a(n) ______________ iterator

An iterator is not always represented by a generator
A generator is a(n) a special type of user defined iterator

\end{solution}
2.7 Write a generator function `gen_inf` that returns a generator which yields all the numbers in the provided list one by one in an infinite loop.

```python
def gen_inf(lst):
    for num in lst:
        yield num
```

```python
>>> t = gen_inf([3, 4, 5])
>>> next(t)
3
>>> next(t)
4
>>> next(t)
5
>>> next(t)
3
>>> next(t)
4
```
Implement a generator function called `filter(iterable, fn)` that only yields elements of iterable for which `fn` returns True.

```python
def naturals():
    i = 1
    while True:
        yield i
        i += 1

def filter(iterable, fn):
    """
    >>> is_even = lambda x: x % 2 == 0
    >>> list(filter(range(5), is_even))
    [0, 2, 4]
    >>> all_odd = (2*y-1 for y in range(5))
    >>> list(filter(all_odd, is_even))
    []
    >>> s = filter(naturals(), is_even)
    >>> next(s)
    2
    >>> next(s)
    4
    """
```

What could you use a generator for that you could not use a standard iterator paired with a function for?
Define `tree_sequence`, a generator that iterates through a tree by first yielding the root value and then yielding the values from each branch.

```python
def tree_sequence(t):
    """
    >>> t = tree(1, [tree(2, [tree(5)]), tree(3, [tree(4)])])
    >>> print(list(tree_sequence(t)))
    [1, 2, 5, 3, 4]
    """
```
2.11 Write a function `make_digit_getter` that, given a positive integer n, returns a new function that returns the digits in the integer one by one, starting from the rightmost digit.

Once all digits have been removed, subsequent calls to the function should return the sum of all the digits in the original integer.

```python
def make_digit_getter(n):
    """ Returns a function that returns the next digit in n each time it is called, and the total value of all the integers once all the digits have been returned.
    >>> year = 8102
    >>> get_year_digit = make_digit_getter(year)
    >>> for _ in range(4):
    ...     print(get_year_digit())
    2
    0
    1
    8
    >>> get_year_digit()
    11
    """
```
2.12 Sorry another environment diagram, but it’s the last one I promise.

```python
def iter(iterable):
    def iterator(msg):
        nonlocal iterable
        if msg == 'next':
            next = iterable[0]
            iterable = iterable[1:]
            return next
        elif msg == 'stop':
            raise StopIteration
        return iterator

def next(iterator):
    return iterator('next')

def stop(iterator):
    iterator('stop')

lst = [1, 2, 3]
iterator = iter(lst)
elem = next(iterator)
```
